Preface

Oceanic Observations of the Pacific is a medium for publication of oceanographic data collected in the Pacific Ocean and its adjacent seas by the cooperating agencies. At the present time these agencies are Scripps Institution of Oceanography of the University of California, San Diego, California; Biological Laboratory of the Bureau of Commercial Fisheries, Honolulu, Hawaii (formerly Pacific Oceanic Fishery Investigations); Biological Laboratory of the Bureau of Commercial Fisheries, La Jolla, California (formerly South Pacific Fishery Investigations); Biological Laboratory of the Bureau of Commercial Fisheries, Seattle, Washington (formerly Pacific Salmon Investigations); Department of Oceanography of the University of Washington, Seattle, Washington; Pacific Oceanographic Group of the Fisheries Research Board of Canada, Nanaimo, British Columbia; United States Navy Electronics Laboratory, San Diego, California. Certain cruises were carried out jointly as California Cooperative Oceanic Fisheries Investigations (CCOFI). The agencies cooperating in the CCOFI program are the Scripps Institution, the Biological Laboratory of the Bureau of Commercial Fisheries, La Jolla, the California Department of Fish and Game, the Hopkins Marine Station and the California Academy of Sciences.

In addition to the cooperating agencies, the United States Coast and Geodetic Survey, Washington, D. C., participated in two of the cruises presented in this volume.

A grant from the National Science Foundation has supported part of the cost of preparing these data for publication and most of the printing cost.

The present volume contains observations made in 1954. For each oceanographic station, values of temperature, salinity and oxygen are tabulated at observed and at standard depths. Computed values of density, specific volume anomaly or thermosteric anomaly, and geopotential anomaly are also tabulated at standard depths. In addition, some observations of phosphate are included. The positions of the serial observations and the numbers of bathythermograph observations made in 1954 and during the period 1941 through 1954 are shown on charts. Information concerning each cruise is summarized in a table.

Description of Observations

SIGNIFICANCE OF REPORTED OCEANOGRAPHIC DATA

Routine field measurements of oceanographic parameters by conventional methods are usually subject to at least the following random errors:

depth	± 4 m (in the upper 1000 m)
temperature	± 0.02°C
salinity	± 0.03‰
oxygen	± 0.04 ml/L
phosphate	± 0.05 to 0.1 μg at/L

A recent analysis of the precision of field measurements of temperature and salinity is that of Wooster and Taft (1958). It should be noted that the above estimate of salinity precision refers to analyses by Knudsen titration.

Interpolated values at standard depths are known with less precision, and the resulting uncertainty in specific volume anomaly and thermosteric anomaly at standard depths due to random errors in field measurements of temperature, salinity and depth is of the order of three centiliters per ton. Therefore, in this publication series it is the practice to report specific volume anomaly and thermosteric anomaly to no more than one part in 10^5 (one cl/ton) and geopotential anomaly to no more than the nearest dynamic centimeter.

It should be noted also that computations of salinity (from measured chlorinity) and density (sigma-t, specific volume anomaly and thermosteric anomaly) reported in this volume have all been based on the empirical equations and tables by Knudsen (1901) and Ekman (1908). Because of the inadequacy of our present knowledge of the equation of state of sea water (Eckart, 1958) and the uncertainty of the relationship between chlorinity and salinity (Carritt and Carpenter, 1959), it is possible that these computed values differ systematically from the absolute values. However, in the upper thousand meters at least, Reid (1959) has shown that the influence of such systematic errors on the accuracy of computed geostrophic flow is significantly smaller than the influence of errors in the determination of temperature, salinity, pressure and position.

NOTES ON PARTICULAR CRUISES

California Cooperative Oceanic Fisheries Investigations

The salinity samples collected on some CCOFI cruises were titrated manually (5401, RV Stranger; 5404, all vessels; 5407, RV Paolina-T; 5411, RV Crest). On other cruises the salinity measurements were obtained by an automatic device which determined the end point by measuring the electrical potential (5409, RV Paolina-T; 5410, all vessels; 5411, RV Spencer F. Baird; 5412, all vessels). On the remaining cruises some samples were titrated manually and some automatically. The random errors in the manual method are estimated to be about 0.025‰ (root mean square); those of the automatic device, about 0.050‰.

Salinity samples from Cruises 5401 through 5405 were not titrated immediately; in some cases titrations were delayed from four to seven months. The sample bottles were carefully sealed and were stored as securely as possible. Comparisons with other data indicate that if evaporation occurred at all, it was very slight (less than the nominal titration accuracy of ±0.025‰).

Expedition Cusp

The Cusp Expedition was devoted primarily to a geophysical and geological study of the sea floor in the region north and south of the Mendocino Fracture Zone.

Expedition Acapulco Trench

The primary purpose of the Acapulco Trench Expedition was geophysical and geological exploration of the sea floor off Central America.

Cruises HMS-25, HMS-26 and CHG-17

The data collected by RV Hugh M. Smith and RV Charles H. Gilbert on these three cruises have been corrected for an error in depth calculation reported by Thomas S. Austin (1962). (This error had been made in the calculation of all data of the RV Hugh M. Smith and RV Charles H. Gilbert reported in Special Scientific Reports, U. S. Fish and Wildlife Service, Fisheries Nos. 168, 180, 201, 217, 238, 252, 315, 358 and part of 164.) The recalculations of the data of the 1954 cruises were made through the facilities of the IGY World Data Center A, Oceanographic Archive, Agricultural and Mechanical College of Texas. Interpolation for values at standard depths was performed by a machine program that fitted a parabola to the four observed values surrounding the desired standard depth (two above and two below), to pass through the two inner observed values and to be a least-squares fit to the two outer observed values. Re-editing by the Bureau of Commercial Fisheries, Honolulu, of these machine calculations was done by comparing them with characteristic curves and then making adjustments for any peculiarities introduced by the machine interpolations where points were widely scattered.

USCGSS Pathfinder and USCGSS Explorer

The interpolation for values at standard depths and determination of calculated depths were carried out by machine programs at the U. S. Naval Oceanographic Office, Washington, D. C. Interpolations were made by the three-point Lagrange method (U. S. N. Hydrogr. Off., 1960; Nat. Oceanogr. Data Center, 1962).

Cruises BB-56, BB-62, BB-64 and BB-67

Interpolation of values at standard depths was performed by the IBM Type 650 Magnetic-Drum Data-Processing Machine in the Research Computer Laboratory of the University of Washington, using the three-point Lagrange curve based upon one point above and two points below the desired depth. Corrections were made for any peculiar interpolations which resulted from use of this method in the upper layers.

General Methods

Unless otherwise indicated, subsurface temperature by paired protected reversing thermometers; salinity by Knudsen method; dissolved oxygen by Winkler method aboard ship; inorganic phosphate analyses by the molybdenum-blue method (Wooster and Rakestraw, 1951).

When available, specific information on accuracy is indicated by footnotes. Absence of such information does not necessarily imply that the nominal accuracies have been achieved.

CCOFI

a CCOFI thermometer calibrations indicate the temperature accuracy to be 0.02°C; tests indicate a salinity accuracy of ±0.025‰ (root mean square) for manual titrations and ±0.050‰ for automatic titrations. See Notes on Particular Cruises.
b Oblique plankton tow to approximately 140 m (200 m of wire out, or less in shallow water) taken with a 30XXX net, 1.0 m in diameter at mouth by approximately 5 m in over-all length with detachable cod end of 56XXX nylon grit gauze.
c BT lowering every half hour en route to first station and on the inshore runs between lines. Hourly lowerings at other times.
d BT lowerings to 900 ft at the time of each hydrographic cast, to 450 ft at midstation net tows and at 2-hour intervals while running between stations. Hourly BT observations were made while running south to the first station.

SIO

a Thermometer calibrations indicate the temperature accuracy to be 0.02°C; field tests indicate a salinity accuracy of ±0.025‰ (root mean square). All salinity titrations were performed manually.
b Thermometer calibrations indicate the temperature accuracy to be 0.02°C; tests indicate a salinity accuracy of ±0.050‰ (root mean square). All salinity measurements were made using an automatic device which determined the end point by measuring the electrical potential.
c Three underway BT profiles (observations at 25- to 30-mile intervals) were completed: from Guadalupe Island to 4°N, 125°W; from 8°N, 127°W to Manzanillo; from Clipperton Atoll to Alijos Rocks, off Baja California. During the latter portion of the third profile two instruments were tightly lashed together and lowered each time as a countercheck.

HBL

a Oblique plankton haul to 200 m taken with a net 1.0 m in diameter at mouth and 0.65 mm in aperture size; duration, 30 minutes.
b Current measurements at 30-mile intervals during the second part of the cruise.
c BT lowerings at all hydrographic stations and at 30-mile intervals between stations except on the run along the islands of the Hawaiian Archipelago between Station 40 and Pearl Harbor where the interval was shortened to 2-1/2 hours or approximately 20 miles.
d Oblique zooplankton hauls to 100 m taken at each hydrographic station with a 30XXX net 1.0 m in diameter at mouth and 0.65 mm in aperture size; duration, 30 minutes.

UW

a Dissolved oxygen by the modified Winkler method described by Thompson and Robinson (1939).
b On deep stations.
c Bucket temperatures in conjunction with BT observations.
d Continuous fixes were made on June 17 to 20 for more than 76 hours, broken by three periods of 20 to 30 minutes to relight or refuel the kerosene lantern on the buoy. The buoy drifted approximately 32 miles. On June 20 to 22 another series of fixes were made for more than 52 hours broken only by one period of 27 minutes to refuel the lantern. The buoy drifted approximately 27 miles.
e Soluble inorganic phosphate by the method of Robinson and Thompson (1948), except that the color intensity was measured with a Beckman Model DU Spectrophotometer (Cary and Beckman, 1941) rather than Nessler tubes. The phosphate data, corrected for salt error, are reported conventionally to the second decimal place although it is realized that the individual determinations may be in error by 5 to 10 per cent.
f Oblique plankton tow from 200 m to the surface taken with a Clarke-Bumpus net 14 cm in mouth diameter, 1.0 m in length, of No. 6 mesh. Duration of haul was approximately 30 minutes.
g Surface plankton tows taken with half-meter and one-meter nets towed behind the ship. The half-meter nets were 50 cm in mouth diameter, 1.5 m in length, of No. 6 mesh size. The one-meter nets were 1.0 m in mouth diameter, 12 ft in length and of No. 6 mesh.
h Vertical hauls from 2000 or 3000 m, using two half-meter nets, 50 cm in mouth diameter, 1.5 m in length, one of No. 6 mesh.

Explanation of Tables

SIDE RUNNING HEADS

Cruise-identifying information is shown in the margin near the top of the page. The first line is an abbreviation of the name of the organization responsible for the data. The second and third lines give the cruise identification. In the case of data collected in the California Cooperative Oceanic Fisheries Investigations research program, for example, CCOFI 5401 signifies the January cruise of 1954.

Individual station numbers are given in the margin opposite the station data. Raised numbers for the CCOFI stations indicate a position between lines or between stations of the standard station pattern. Station locations are shown in the appropriate position charts.

HEADINGS OF GROUPS OF COLUMNS

OBSERVED: Corrected data at accepted depths of observation.

INTERPOLATED: Data at standard depths, interpolated from smooth distribution curves or by machine-interpolation programs (see Notes on Particular Cruises). The standard depths are those selected by the agencies.

COMPUTED: The results of computations based, in general, on interpolated values.

COLUMN HEADINGS

Z — Depth in meters at which observation was made or an interpolated value obtained.

T — Temperature of water in degrees Celsius.

S — Salinity of water in grams per kilogram (‰).

O_2 — Concentration of dissolved oxygen in milliliters per liter (ml/L).

PO_4-P — Concentration of dissolved inorganic phosphorus in microgram atoms per liter (μg at/L) or micromoles per liter.

σ_t — Sigma-t in grams per liter (g/L). Sigma-t can be defined

$$\sigma_t = 1000\ (\rho_{ST0} - 1)$$

where ρ_{ST0} is the density, in grams per milliliter, of water of salinity, S, temperature, T, and at standard atmospheric pressure. Density is expressed in these units to be consistent with the tables used for the computations.

δ — Specific volume anomaly, in centiliters per ton (cl/ton), although most of the column headings state $10^{-5}cm^3/g$. The difference between the two units is negligible in these data (Pollak, 1961), but the correct units are centiliters per ton (or $10^{-5}ml/g$). Specific volume anomaly is defined as the difference between the specific volume of the water at a specified depth and the specific volume of a standard water with salinity of 35‰ and temperature of 0°C at the same depth. Specific volume anomaly is expressed in these units to be consistent with the tables used for the computations.

δ_T — Thermosteric anomaly, the pressure-independent part of the specific volume anomaly. Specific volume anomaly is defined

$$\delta = \alpha_{stp} - \alpha_{35,0,p}$$

and is computed as

$$\delta = \Delta_{st} + \delta_{sp} + \delta_{tp}$$

The quantity Δ_{st} has been discussed by Sverdrup, Johnson and Fleming (1946, p. 58) and approximately represents potential specific volume anomaly. It is used here with the name (thermosteric anomaly), symbol (δ_T) and unit (centiliter per ton) suggested by Montgomery and Wooster (1954) although most of the column headings state $10^{-5}cm^3/g$. The difference between the two units is negligible in these data (Pollak, 1961), but the correct units are centiliters per ton.

ΔD — Geopotential anomaly, in dynamic meters (dynamic height), of the layer of water between the surface and the designated standard pressure. Geopotential anomaly is the difference between the geopotential thickness of the observed layer and the geopotential thickness of a layer bounded by the same pressures but having standard temperature, 0°C, and salinity, 35‰. The tabulated anomaly is determined from an approximation of the integral

$$\Delta D = \int_0^{p_z} \delta\ dp$$

where p is pressure in decibars (assumed equal to depth in meters) and subscript z denotes the value at the bottom of the layer under consideration. Since geopotential thickness is the product of geometrical thickness and the acceleration of gravity, a dynamic meter is equal to 10^5 ergs per gram and is the change in geopotential over a vertical distance of approximately 1.02 meter.

SUPPLEMENTARY STATION INFORMATION

Supplementary information about each station is to be found just above the tabulated data. This information includes name of ship, date and time of observation, geographical location of station, depth of water, wind direction and force (usually Beaufort scale), a description of surface weather and sea state, and wire angle. When there is more than one cast on a station, messenger times and wire angles are given for the casts in the order of increasing depth.

NOTES ON THE TABULATION OF DATA

1. Observed temperatures obtained by thermograph, bucket thermometer or bathythermograph are reported only to tenths of a degree. Temperatures by reversing thermometer are reported to hundredths of a degree.

2. Missing observed values are indicated by a hyphen (-).

3. Extrapolated values and values interpolated between remote observations are entered within parentheses.

4. Observed data from different casts are separated by a blank line.

5. The following notations have been used where appropriate.

For premature or delayed closure of water bottle and reversal of thermometers:

p pretrip or posttrip

For values which are not used in interpolation because they seem to be in error:

r rejected value

u uncertain value

a) Salinity sample at 65 meters was listed originally at 55 meters; it is assumed now to be listed correctly.

b) Alternate value, 5.27 ml/L; not used in interpolation.

a) Duplicate salinity titration values differ by more than 0.02‰ but less than 0.07‰; value tabulated is interpolated between the duplicates from the station curve. Value seems anomalous, but not positively out.

b) Duplicate salinity titration values differ by more than 0.02‰ but less than 0.07‰; value tabulated is interpolated between the duplicates from the station curve.

a) Cruise 26 of RV Hugh M. Smith was primarily a skipjack scouting cruise and, therefore, hydrographic observations are designated by odd numbers.

b) Alternate value, 4.74 ml/L.

a) All depths somewhat questionable.

b) Last three bottles below this depth apparently fouled a ridge.

a) Bathythermograph data were used to obtain the temperature profile and interpolated values in the upper 250 meters on all stations but this one and the station occupied on September 14 in the Experimental Area (no BT data available).

b) Values of thermosteric anomaly were computed by the Data Collecting and Processing Group of Scripps Institution.

c) Overlapping cast.
